New range of infrared alarm transmitters

The new transmitters from SAS are now available for use with our RED ALERT staff attack system.

Although our original range of transmitters are still popular, the latest transmitters have new additional features, which are proving invaluable to our clients.

One of the main innovations is the move to rechargeable batteries. There is no longer a need to stock, or worry about disposal of replacement batteries. Simply plug the transmitter into a charger for up to 1½ hours. When fully charged, it will last for up to 12 months.

To compliment this feature a test button is included. Pressing this button illuminates an led, indicating the level of charge remaining in the battery. It also sends an infrared test signal to the nearest receiver causing its reassurance light to flash – giving confirmation that a full function test has been completed. In the event of a transmitter not being tested a “low battery” warning will bleep as an additional safeguard.

With the Curo, we have kept the tried and tested method of push-button and pull pin to activate two different call levels, however in addition, the pull pin now has the option of retaining or pulling away. Two side buttons have been added to the Curo transmitter. These are double-press

‘squeeze’ buttons and can be programmed to send out any type of alarm signal.

The Curo is extremely robust, the ergonomic lightweight design has tactile rubber edges providing both excellent grip and protection for the unit when used in an unfriendly environment.

A clothing clip, enabling easy attachment to hospital ‘greens’, and a heavy duty clothing clip are provided.

ID Card Holder

Many organisations require staff to wear ID Cards, making this product an ideal solution – A combined card holder and staff attack transmitter, designed to hold standard ID Cards.

This extremely lightweight and discreet transmitter sits comfortably on clothing using the clothing clip provided, although if preferred it could be worn with a neck chain.

As with the Curo, this transmitter uses rechargeable batteries. Buttons on the back of the transmitter and a pair of side mounted double action ‘squeeze’ buttons are used to send alarm calls. There is also a test button, allowing staff to easily check battery levels and functionality.
